MCP73833/4

Stand-Alone Linear Li-Ion / Li-Polymer Charge Management Controller

Features

- Complete Linear Charge Management Controller
  - Integrated Pass Transistor
  - Integrated Current Sense
  - Integrated Reverse Discharge Protection
- Constant Current/Constant Voltage Operation with Thermal Regulation
- High Accuracy Preset Voltage Regulation:
  - 4.2V, 4.35V, 4.4V, 4.45V or 4.5V, ±0.75%
- Programmable Charge Current: 1A Maximum
- Preconditioning of Deeply Depleted Cells
  - Selectable Current Ratio
  - Selectable Voltage Threshold
- Automatic End-of-Charge Control
  - Selectable Current Threshold
  - Selectable Safety Time Period
- Automatic Recharge
  - Selectable Voltage Threshold
- Two Charge Status Outputs
- Cell Temperature Monitor
- Low-Dropout Linear Regulator Mode
- Automatic Power-Down when Input Power Removed
- Under Voltage Lockout
- Numerous Selectable Options Available for a Variety of Applications:
  - Refer to **Section 1.0 "Electrical Characteristics"** for Selectable Options
  - Refer to the Product Identification System for Standard Options
- Available Packages:
  - DFN-10 (3 mm x 3 mm)
  - MSOP-10

Applications

- Lithium-Ion / Lithium-Polymer Battery Chargers
- Personal Data Assistants
- Cellular Telephones
- Digital Cameras
- MP3 Players
- Bluetooth Headsets
- USB Chargers

Description

The MCP73833/4 is a highly advanced linear charge management controller for use in space-limited, cost sensitive applications. The MCP73833/4 is available in a 10-Lead, 3 mm x 3 mm DFN package or a 10-Lead, MSOP package. Along with its small physical size, the low number of external components required makes the MCP73833/4 ideally suited for portable applications. For applications charging from a USB port, the MCP73833/4 can adhere to all the specifications governing the USB power bus.

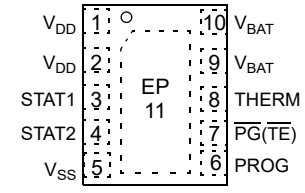

The MCP73833/4 employs a constant current/constant voltage charge algorithm with selectable preconditioning and charge termination. The constant voltage regulation is fixed with four available options: 4.20V, 4.35V, 4.40V, 4.45V or 4.50V, to accommodate new, emerging battery charging requirements. The constant current value is set with one external resistor. The MCP73833/4 limits the charge current based on die temperature during high power or high ambient conditions. This thermal regulation optimizes the charge cycle time while maintaining device reliability.

Several options are available for the preconditioning threshold, preconditioning current value, charge termination value, and automatic recharge threshold. The preconditioning value and charge termination value are set as a ratio, or percentage, of the programmed constant current value. Preconditioning can be set to 100%. Refer to **Section 1.0 "Electrical Characteristics"** for available options and the Product Identification System for standard options.

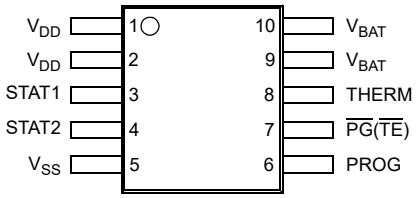

The MCP73833/4 is fully specified over the ambient temperature range of −40°C to +85°C.

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

V_{DD}.....7.0V
All Inputs and Outputs w.r.t., V_{SS}.....−0.3 to (V_{DD}+0.3)V
Maximum Junction Temperature, T_J.....Internally Limited
Storage temperature.....−65°C to +150°C
ESD protection on all pins:
Human Body Model (HBM – 1.5 kΩ in Series with 100 pF).....≥ 4 kV
Machine Model (MM – 200 pF, No Series Resistance).....300V

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise specified, all limits apply for V_{DD} = [V_{REG}(Typical) + 0.3V] to 6V, T_A = −40°C to 85°C. Typical values are at +25°C, V_{DD} = [V_{REG}(Typical) + 1.0V]

Parameters	Sym	Min	Typ	Max	Units	Conditions
Supply Input						
Supply Voltage	V_{DD}	3.75	—	6	V	Charging
		V_{REG}(Typical)+0.3V	—	6	V	Charge Complete, Standby
Supply Current	I_{SS}	—	2000	3000	µA	Charging
		—	150	300	µA	Charge Complete
		—	100	300	µA	Standby (No Battery or PROG Floating)
		—	50	100	µA	Shutdown ($V_{DD} \le V_{BAT}$, or $V_{DD} < V_{STOP}$)
UVLO Start Threshold	V_{START}	3.4	3.55	3.7	V	V_{DD} Low-to-High
UVLO Stop Threshold	V_{STOP}	3.3	3.45	3.6	V	V_{DD} High-to-Low
UVLO Hysteresis	V_{HYS}	—	100	—	mV	
Voltage Regulation (Constant Voltage Mode, System Test Mode)						
Regulated Output Voltage	V_{REG}	4.168	4.20	4.232	V	V_{DD} = [V_{REG}(Typical) + 1V] I_{OUT} = 10 mA T_A = −5°C to +55°C
		4.318	4.35	4.382	V	
		4.367	4.40	4.433	V	
		4.416	4.45	4.483	V	
		4.467	4.50	4.533	V	
Line Regulation	$\lvert(\Delta V_{BAT}/V_{BAT})/\Delta V_{DD}\rvert$	—	0.10	0.30	%/V	V_{DD} = [V_{REG}(Typical)+1V] to 6V, I_{OUT} = 10 mA
Load Regulation	$\lvert\Delta V_{BAT}/ V_{BAT}\rvert$	—	0.10	0.30	%	I_{OUT} = 10 mA to 100 mA V_{DD} = [V_{REG}(Typical)+1V]
Supply Ripple Attenuation	PSRR	—	58	—	dB	I_{OUT} = 10 mA, 10Hz to 1 kHz
		—	47	—	dB	I_{OUT} = 10 mA, 10Hz to 10 kHz

2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, V_{DD} = 5.2V, V_{REG} = 4.20V, I_{OUT} = 10 mA and T_A= +25°C, Constant-voltage mode.

3.0 PIN DESCRIPTIONS

Descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

Pin No.		Symbol	Function
DFN-10	MSOP-10		
1	1	V_{DD}	Battery Management Input Supply
2	2	V_{DD}	Battery Management Input Supply
3	3	STAT1	Charge Status Output
4	4	STAT2	Charge Status Output
5	5	V_{SS}	Battery Management 0V Reference
6	6	PROG	Current Regulation Set and Charge Control Enable
7	7	$\overline{PG}$, $\overline{TE}$	**MCP73833:** Power Good output, **MCP73834**: Timer Enable input
8	8	THERM	Thermistor input
9	9	V_{BAT}	Battery Charge Control Output
10	10	V_{BAT}	Battery Charge Control Output
11	—	EP	Exposed Thermal Pad (EP); must be connected to V_{SS}.

3.1 Battery Management Input Supply (V_{DD})

A supply voltage of [V_{REG} (typical) + 0.3V] to 6V is recommended. Bypass to V_{SS} with a minimum of 1 µF.

3.2 Charge Status Outputs (STAT1, STAT2)

STAT1 and STAT2 are open-drain logic outputs for connection to a LED for charge status indication. Alternatively, a pull-up resistor can be applied for interfacing to a host microcontroller.

3.3 Battery Management 0V Reference (V_{SS})

Connect to negative terminal of battery and input supply.

3.4 Current Regulation Set (PROG)

Preconditioning, fast charge, and termination currents are scaled by placing a resistor from PROG to V_{SS}.

The charge management controller can be disabled by allowing the PROG input to float.

3.5 Power Good Indication ($\overline{PG}$) MCP73833 Only

The power good ($\overline{PG}$) option is a pseudo open-drain output. The $\overline{PG}$ output can sink current, but not source current. However, there is a diode path back to the input, and, as such, the $\overline{PG}$ output should only be pulled up to the input. The $\overline{PG}$ output is low whenever the input to the MCP73833 is above the UVLO threshold and greater than the battery voltage.

3.6 Timer Enable Input ($\overline{TE}$) MCP73834 Only

The timer enable ($\overline{TE}$) input option is used to enable or disable the internal timer. A low signal on this pin enables the internal timer and a high signal disables the internal timer. The $\overline{TE}$ input can be used to disable the timer when the charger is supplying current to charge the battery and power the system load. The $\overline{TE}$ input is compatible with 1.8V logic.

3.7 Thermistor Input (THERM)

An internal 50 µA current source provides the bias for most common 10 kΩ negative-temperature coefficient thermistors (NTC). The MCP73833/4 compares the voltage at the THERM pin to factory set thersholds of 1.20V and 0.25V, typically.

3.8 Battery Charge Control Output (V_{BAT})

Connect to positive terminal of battery. Drain terminal of internal P-channel MOSFET pass transistor. Bypass to V_{SS} with a minimum of 1 µF to ensure loop stability when the battery is disconnected.

3.9 Exposed Thermal Pad (EP)

There is an internal electrical connection between the Exposed Thermal Pad (EP) and the V_{SS} pin; they must be connected to the same potential.

© 2009-2025 Microchip Technology Inc. and its subsidiaries

4.0 FUNCTIONAL DESCRIPTION

The MCP73833/4 is a highly advanced linear charge management controller. Refer to the functional block diagram and Figure 4-1 that depicts the operational flow algorithm from charge initiation to completion and automatic recharge.

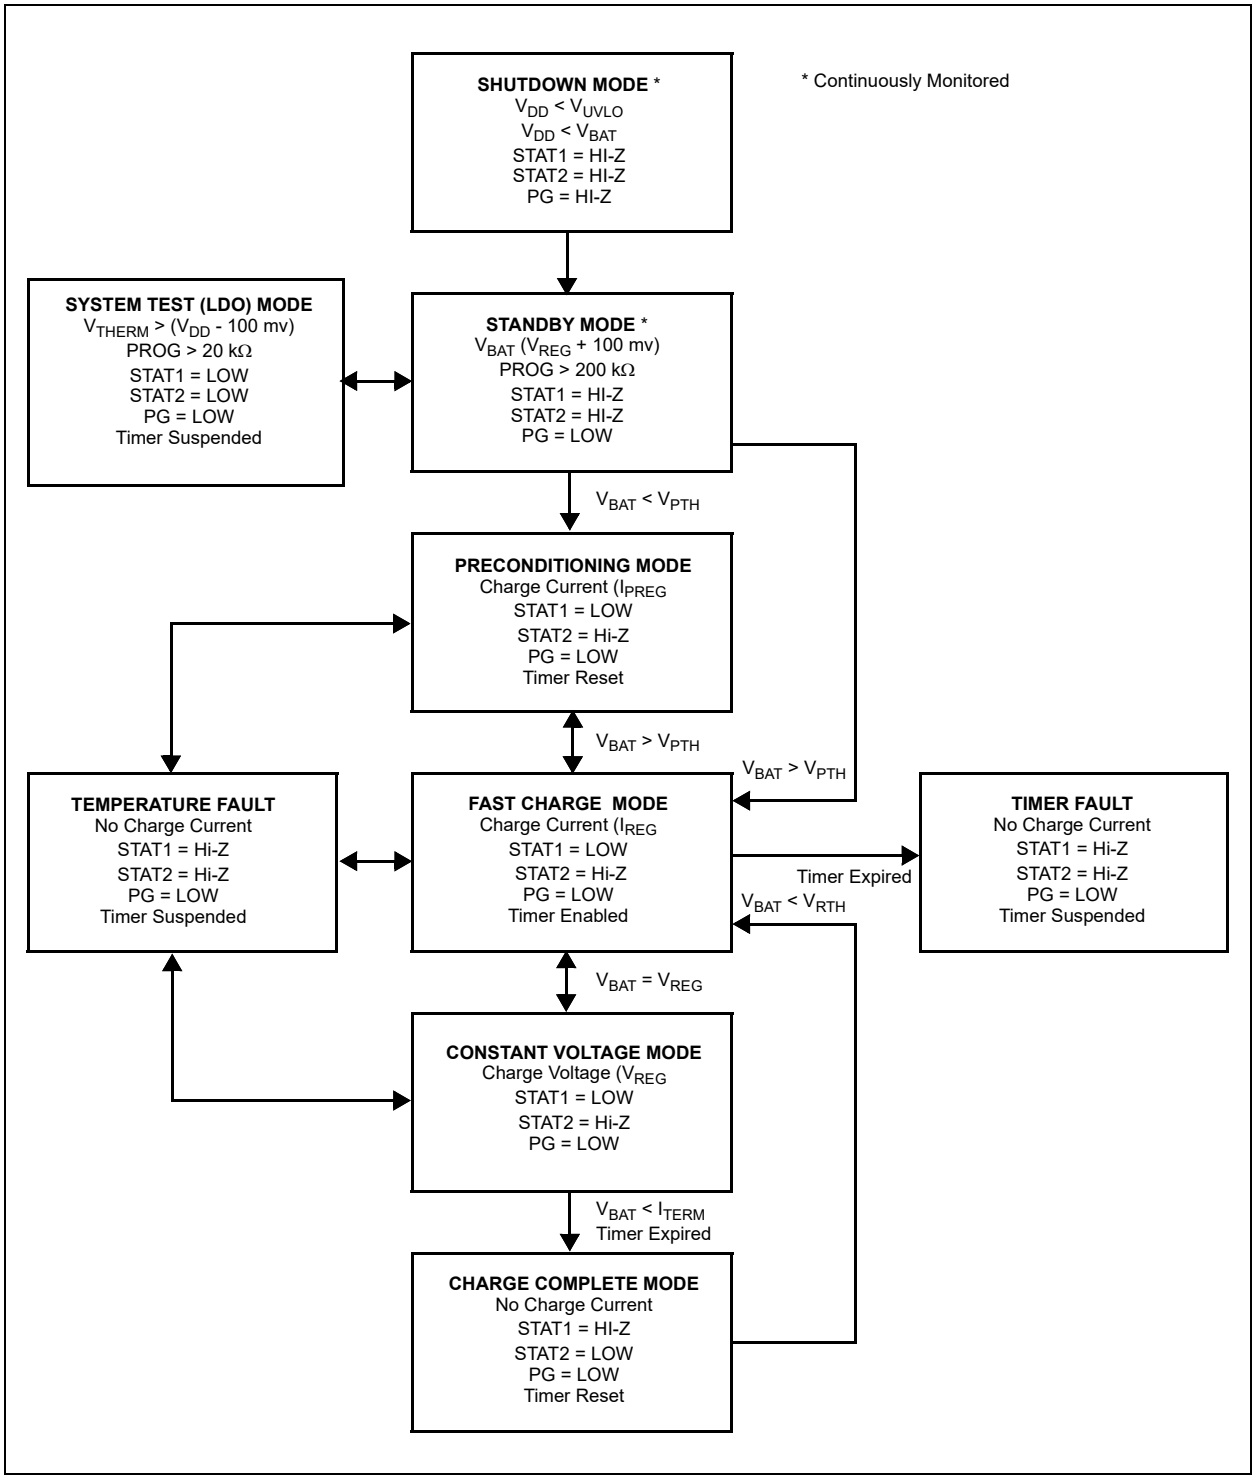

FIGURE 4-1: *Flow Chart.*

© 2009-2025 Microchip Technology Inc. and its subsidiaries

4.1 Under Voltage Lockout (UVLO)

An internal under voltage lockout (UVLO) circuit monitors the input voltage and keeps the charger in shutdown mode until the input supply rises above the UVLO threshold. The UVLO circuitry has a built-in hysteresis of 100 mV.

In the event a battery is present when the input power is applied, the input supply must rise +150 mV above the battery voltage before the MCP73833/4 becomes operational.

The UVLO circuit places the device in shutdown mode if the input supply falls to within +50 mV of the battery voltage.

The UVLO circuit is always active. At any time the input supply is below the UVLO threshold or within +50 mV of the voltage at the V_{BAT} pin, the MCP73833/4 is placed in a shutdown mode.

During any UVLO condition, the battery reverse discharge current shall be less than 2 µA.

4.2 Charge Qualification

For a charge cycle to begin, all UVLO conditions must be met and a battery or output load must be present.

A charge current programming resistor must be connected from PROG to V_{SS}. If the PROG pin is open or floating, the MCP73833/4 is disabled and the battery reverse discharge current is less than 2 µA. In this manner, the PROG pin acts as a charge enable and can be used as a manual shutdown.

If the input supply voltage is above the UVLO threshold, but below V_{REG}(Typical)+0.3V, the MCP73833/4 will pulse the STAT1 and PG outputs as the device determines if a battery is present.

4.3 Preconditioning

If the voltage at the V_{BAT} pin is less than the preconditioning threshold, the MCP73833/4 enters a preconditioning or trickle charge mode. The preconditioning threshold is factory set. Refer to **Section 1.0 "Electrical Characteristics"** for preconditioning threshold options.

In this mode, the MCP73833/4 supplies a percentage of the charge current (established with the value of the resistor connected to the PROG pin) to the battery. The percentage or ratio of the current is factory set. Refer to **Section 1.0 "Electrical Characteristics"** for preconditioning current options.

When the voltage at the V_{BAT} pin rises above the pre-conditioning threshold, the MCP73833/4 enters the constant current or fast charge mode.

4.4 Constant Current - Fast Charge Mode

During the constant current mode, the programmed charge current is supplied to the battery or load. The charge current is established using a single resistor from PROG to V_{SS}. The program resistor and the charge current are calculated using Equation 4-1:

EQUATION 4-1:

Where:

$$I_{REG} = \frac{1000V}{R_{PROG}}$$

R_{PROG} = kilo-ohms

I_{REG} = milliampere

Constant current mode is maintained until the voltage at the V_{BAT} pin reaches the regulation voltage, V_{REG}.

When constant current mode is invoked, the internal timer is reset.

4.4.1 TIMER EXPIRED DURING CONSTANT CURRENT - FAST CHARGE MODE

If the internal timer expires before the recharge voltage threshold is reached, a timer fault is indicated and the charge cycle terminates. The MCP73833/4 remains in this condition until the battery is removed, the input power is removed, or the PROG pin is opened. If the battery is removed or the PROG pin is opened, the MCP73833/4 enters the Standby mode where it remains until a battery is reinserted or the PROG pin is reconnected. If the input power is removed, the MCP73833/4 is in Shutdown. When the input power is reapplied, a normal start-up sequence ensues.

4.5 Constant Voltage Mode

When the voltage at the V_{BAT} pin reaches the regulation voltage, V_{REG}, constant voltage regulation begins. The regulation voltage is factory set to 4.20V, 4.35V, 4.40V, or 4.50V with a tolerance of ± 0.75%.

4.6 Charge Termination

The charge cycle is terminated when, during constant voltage mode, the average charge current diminishes below a percentage of the programmed charge current (established with the value of the resistor connected to the PROG pin) or the internal timer has expired. A 1 ms filter time on the termination comparator ensures that transient load conditions do not result in premature charge cycle termination. The percentage or ratio of the current is factory set. The timer period is factory set and can be disabled. Refer to **Section 1.0 "Electrical Characteristics"** for charge termination current ratio and timer period options.

The charge current is latched off and the MCP73833/4 enters a charge complete mode.

© 2009-2025 Microchip Technology Inc. and its subsidiaries

4.7 Automatic Recharge

The MCP73833/4 continuously monitors the voltage at the V_{BAT} pin in the charge complete mode. If the voltage drops below the recharge threshold, another charge cycle begins and current is once again supplied to the battery or load. The recharge threshold is factory set. Refer to **Section 1.0 "Electrical Characteristics"** for recharge threshold options.

4.8 Thermal Regulation

The MCP73833/4 limits the charge current based on the die temperature. The thermal regulation optimizes the charge cycle time while maintaining device reliability. Figure 4-2 depicts the thermal regulation for the MCP73833/4.

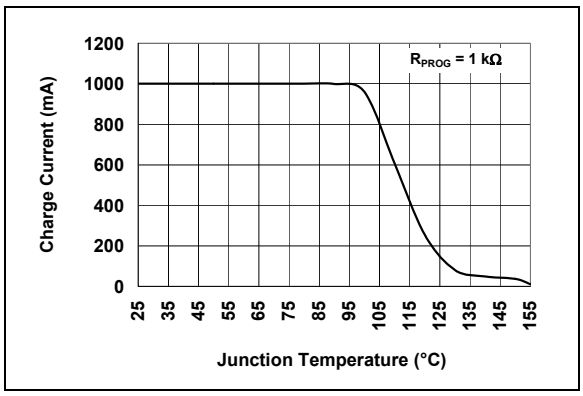

FIGURE 4-2: *Thermal Regulation.*

4.9 Thermal Shutdown

The MCP73833/4 suspends charge if the die temperature exceeds +150°C. Charging will resume when the die temperature has cooled by approximately +10°C. The thermal shutdown is a secondary safety feature in the event that there is a failure within the thermal regulation circuitry.

© 2009-2025 Microchip Technology Inc. and its subsidiaries

5.0 DETAILED DESCRIPTION

5.1 Analog Circuitry

5.1.1 BATTERY MANAGEMENT INPUT SUPPLY (V_{DD})

The V_{DD} input is the input supply to the MCP73833/4. The MCP73833/4 automatically enters a Power-down mode if the voltage on the V_{DD} input falls below the UVLO voltage (V_{STOP}). This feature prevents draining the battery pack when the V_{DD} supply is not present.

5.1.2 CURRENT REGULATION SET (PROG)

Fast charge current regulation can be scaled by placing a programming resistor (R_{PROG}) from the PROG input to V_{SS}. The program resistor and the charge current are calculated using the Equation 5-1:

EQUATION 5-1:

$$I_{REG} = \frac{1000V}{R_{PROG}}$$

Where:

R_{PROG} = kilo-ohms

I_{REG} = milliampere

The preconditioning trickle-charge current and the charge termination current are ratiometric to the fast charge current based on the selected device options.

5.1.3 BATTERY CHARGE CONTROL OUTPUT (V_{BAT})

The battery charge control output is the drain terminal of an internal P-channel MOSFET. The MCP73833/4 provides constant current and voltage regulation to the battery pack by controlling this MOSFET in the linear region. The battery charge control output should be connected to the positive terminal of the battery pack.

5.1.4 TEMPERATURE QUALIFICATION (THERM)

The MCP73833/4 continuously monitors battery temperature during a charge cycle by measuring the voltage between the THERM and V_{SS} pins. An internal 50 µA current source provides the bias for most common 10 kΩ negative-temperature coefficient (NTC) or positive-temperature coefficient (PTC) thermistors.The current source is controlled, avoiding measurement sensitivity to fluctuations in the supply voltage (V_{DD}). The MCP73833/4 compares the voltage at the THERM pin to factory set thersholds of 1.20V and 0.25V, typically. Once a volage outside the thresholds is detected during a charge cycle, the MCP73833/4 immediately suspends the charge cycle. The MCP73833/4 suspends charge by turning off the pass transistor and holding the timer value. The charge cycle resumes when the voltage at the THERM pin returns to the normal range.

If temperature monitoring is not required, place a standard 10 kΩ resistor from THERM to V_{SS}.

5.1.4.1 System Test (LDO) Mode

The MCP73833/4 can be placed in a system test mode. In this mode, the MCP73833/4 operates as a low dropout linear regulator (LDO). The output voltage is regulated to the factory set voltage regulation option. The available output current is limitted to the programmed fast charge current. For stability, the V_{BAT} output must be bypassed to V_{SS} with a minimum capacitance of 1 µF for output currents up to 250 mA. A minimum capacitance of 4.7 µF is required for output currents above 250 mA.

The system test mode is entered by driving the THERM input greater than (V_{DD} − 100 mV) with no battery connected to the output. In this mode, the MCP73833/4 can be used to power the system without a battery present.

Note 1: I_{THERM} is disabled during shutdown, stand-by, and system test modes.

2: A pull-down current source on the THERM input is active only in stand-by and system test modes.

3: During system test mode, the PROG input sets the available output current limit.

4: System test mode shall be exited by releasing the THERM input or cycling input power.

5.2 Digital Circuitry

5.2.1 STATUS INDICATORS AND POWER GOOD ($\overline{PG}$ - OPTION)

The charge status outputs have two different states: Low (L), and High Impedance (Hi-Z). The charge status outputs can be used to illuminate LEDs. Optionally, the charge status outputs can be used as an interface to a host microcontroller. Table 5-1 summarize the state of the status outputs during a charge cycle.

TABLE 5-1: STATUS OUTPUTS

Charge Cycle State	STAT1	STAT2	PG
Shutdown	Hi-Z	Hi-Z	Hi-Z
Standby	Hi-Z	Hi-Z	L
Charge in Progress	L	Hi-Z	L
Charge Complete (EOC)	Hi-Z	L	L
Temperature Fault	Hi-Z	Hi-Z	L
Timer Fault	Hi-Z	Hi-Z	L
System Test Mode	L	L	L

© 2009-2025 Microchip Technology Inc. and its subsidiaries

5.2.2 POWER GOOD ($\overline{PG}$) OPTION

The power good ($\overline{PG}$) option is a pseudo open-drain output. The $\overline{PG}$ output can sink current, but not source current. However, there is a diode path back to the input, and as such, the $\overline{PG}$ output should only be pulled up to the input. The $\overline{PG}$ output is low whenever the input to the MCP73833 is above the UVLO threshold and greater than the battery voltage. If the supply voltage is above the UVLO, but below V_{REG}(Typical)+0.3V, the MCP73833 will pulse the PG output as the device determines if a battery is present.

5.2.3 TIMER ENABLE ($\overline{TE}$) OPTION

The timer enable ($\overline{TE}$) input option is used to enable or disable the internal timer. A low signal on this pin enables the internal timer and a high signal disables the internal timer. The $\overline{TE}$ input can be used to disable the timer when the charger is supplying current to charge the battery and power the system load. The $\overline{TE}$ input is compatible with 1.8V logic.

5.2.4 DEVICE DISABLE (PROG)

The current regulation set input pin (PROG) can be used to terminate a charge at any time during the charge cycle, as well as to initiate a charge cycle or initiate a recharge cycle.

Placing a programming resistor from the PROG input to V_{SS} enables the device. Allowing the PROG input to float or by applying a logic-high input signal, disables the device and terminates a charge cycle. When disabled, the device's supply current is reduced to 100 µA, typically.

6.0 APPLICATIONS

The MCP73833/4 is designed to operate in conjunction with a host microcontroller or in stand-alone applications. The MCP73833/4 provides the preferred charge algorithm for Lithium-Ion and Lithium-Polymer cells Constant-current followed by Constant-voltage. Figure 6-1 depicts a typical stand-alone application circuit, while Figures 6-2 and 6-3 depict the accompanying charge profile.

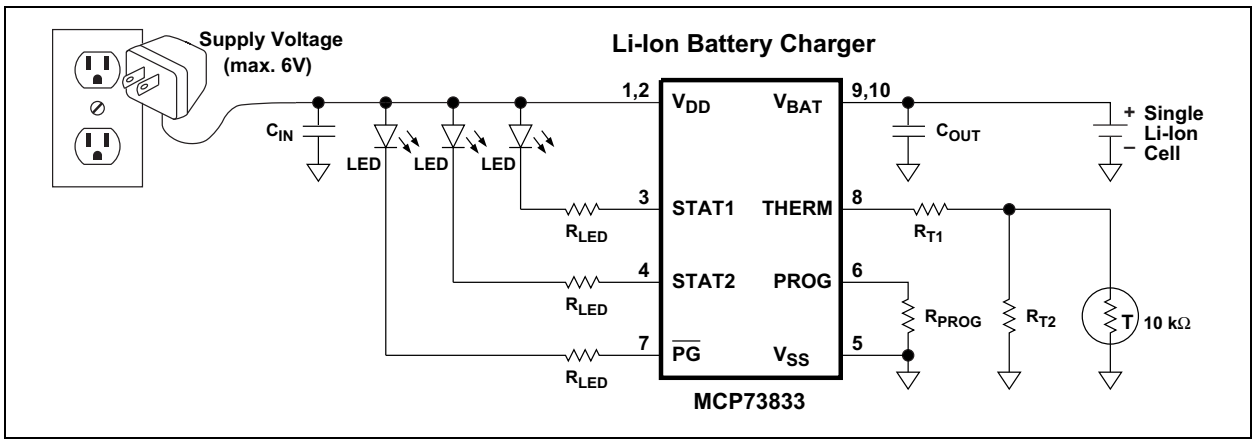

FIGURE 6-1: *Typical Application Circuit.*

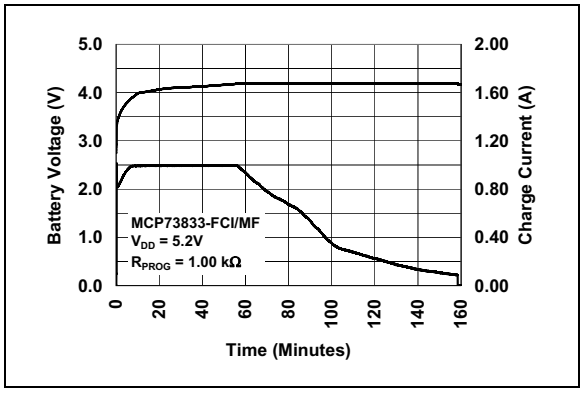

FIGURE 6-2: *Typical Charge Profile with Thermal Regulation (1700 mAh Li-Ion Battery).*

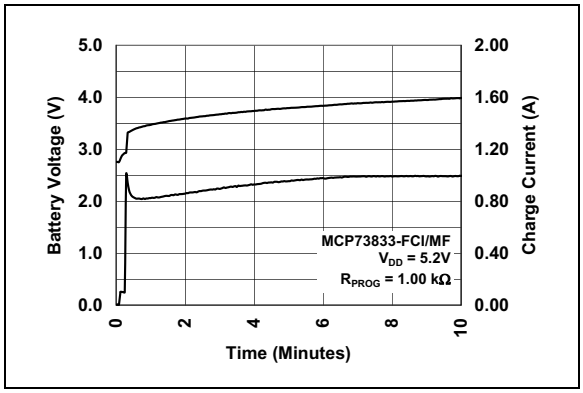

FIGURE 6-3: *Typical Charge Cycle Start with Thermal Regulation (1700 mAh Li-Ion Battery).*

6.1 Application Circuit Design

Due to the low efficiency of linear charging, the most important factors are thermal design and cost, which are a direct function of the input voltage, output current and thermal impedance between the battery charger and the ambient cooling air. The worst-case scenario is when the device has transitioned from the Preconditioning mode to the Constant-current mode. In this situation, the battery charger has to dissipate the maximum power. A trade-off must be made between the charge current, cost and thermal requirements of the charger.

6.1.1 COMPONENT SELECTION

Selection of the external components in Figure 6-1 is crucial to the integrity and reliability of the charging system. The following discussion is intended as a guide for the component selection process.

6.1.1.1 Current Programming Resistor (R_{PROG})

The preferred fast charge current for Lithium-Ion cells is at the 1C rate, with an absolute maximum current at the 2C rate. For example, a 500 mAh battery pack has a preferred fast charge current of 500 mA. Charging at this rate provides the shortest charge cycle times without degradation to the battery pack performance or life.

© 2009-2025 Microchip Technology Inc. and its subsidiaries

6.1.1.2 Thermal Considerations

The worst-case power dissipation in the battery charger occurs when the input voltage is at the maximum and the device has transitioned from the Preconditioning mode to the Constant-current mode. In this case, the power dissipation is:

$$PowerDissipation = (V_{DDMAX} - V_{PTHMIN}) \times I_{REGMAX}$$

Where:

V_{DDMAX}	=	the maximum input voltage
I_{REGMAX}	=	the maximum fast charge current
V_{PTHMIN}	=	the minimum transition threshold voltage

Power dissipation with a 5V, ±10% input voltage source is:

$$PowerDissipation = (5.5V - 2.7V) \times 550mA = 1.54W$$

This power dissipation with the battery charger in the MSOP-10 package will cause thermal regulation to be entered as depicted in Figure 6-3. Alternatively, the DFN-10 (3 mm x 3 mm) package could be utilized to reduce charge cycle times.

6.1.1.3 External Capacitors

The MCP73833/4 is stable with or without a battery load. In order to maintain good AC stability in the Constant-voltage mode, a minimum capacitance of 4.7 µF is recommended to bypass the V_{BAT} pin to V_{SS}. This capacitance provides compensation when there is no battery load. In addition, the battery and interconnections appear inductive at high frequencies. These elements are in the control feedback loop during Constant-voltage mode. Therefore, the bypass capacitance may be necessary to compensate for the inductive nature of the battery pack.

Virtually any good quality output filter capacitor can be used, independent of the capacitor's minimum Effective Series Resistance (ESR) value. The actual value of the capacitor (and its associated ESR) depends on the output load current. A 4.7 µF ceramic, tantalum or aluminum electrolytic capacitor at the output is usually sufficient to ensure stability for output currents up to a 500 mA.

6.1.1.4 Reverse-Blocking Protection

The MCP73833/4 provides protection from a faulted or shorted input. Without the protection, a faulted or shorted input would discharge the battery pack through the body diode of the internal pass transistor.

6.1.1.5 Charge Inhibit

The current regulation set input pin (PROG) can be used to terminate a charge at any time during the charge cycle, as well as to initiate a charge cycle or initiate a recharge cycle.

Placing a programming resistor from the PROG input to V_{SS} enables the device. Allowing the PROG input to float or by applying a logic-high input signal, disables the device and terminates a charge cycle. When disabled, the device's supply current is reduced to 100 µA, typically.

6.1.1.6 Temperature Monitoring

The charge temperature window can be set by placing fixed value resistors in series-parallel with a thermistor. The resistance values of R_{T1} and R_{T2} can be calculated with the following equations in order to set the temperature window of interest.

For NTC thermistors:

$$24k\Omega = R_{T1} + \frac{R_{T2} \times R_{COLD}}{R_{T2} + R_{COLD}}$$

$$5k\Omega = R_{T1} + \frac{R_{T2} \times R_{HOT}}{R_{T2} + R_{HOT}}$$

Where:

R_{T1}	=	the fixed series resistance
R_{T2}	=	the fixed parallel resistance
R_{COLD}	=	the thermistor resistance at the lower temperature of interest
R_{HOT}	=	the thermistor resistance at the upper temperature of interest

For example, by utilizing a 10 kΩ at 25C NTC thermistor with a sensitivity index, β, of 3892, the charge temperature range can be set to 0C - 50C by placing a 1.54 kΩ resistor in series (R_{T1}), and a 69.8 kΩ resistor in parallel (R_{T2}) with the thermistor as depicted in Figure 6-1.

6.1.1.7 Charge Status Interface

A status output provides information on the state of charge. The output can be used to illuminate external LEDs or interface to a host microcontroller. Refer to Table 5-1 for a summary of the state of the status output during a charge cycle.

© 2009-2025 Microchip Technology Inc. and its subsidiaries

6.2 PCB Layout Issues

For optimum voltage regulation, place the battery pack as close as possible to the device's V_{BAT} and V_{SS} pins, recommended to minimize voltage drops along the high current-carrying PCB traces.

If the PCB layout is used as a heatsink, adding many vias in the heatsink pad can help conduct more heat to the backplane of the PCB, thus reducing the maximum junction temperature. Figures 6-4 and 6-5 depict a typical layout with PCB heatsinking.

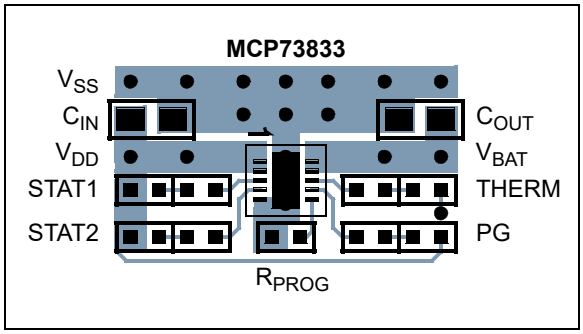

FIGURE 6-4: *Typical Layout (Top).*

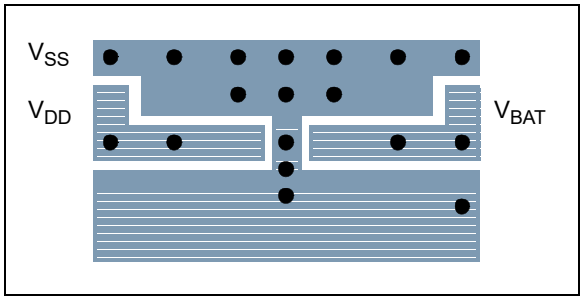

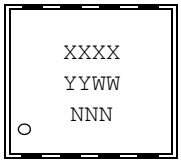

FIGURE 6-5: *Typical Layout (Bottom).*

7.0 PACKAGING INFORMATION

7.1 Package Marking Information

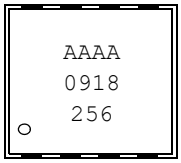

10-Lead DFN (3 × 3)

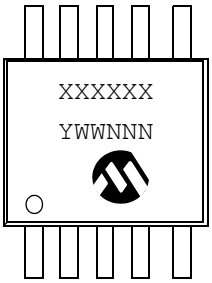

Part Number *	Marking Code	Part Number *	Marking Code
MCP73833-AMI/MF	AAAA		
MCP73833-BZI/MF	AAAB		
MCP73833-FCI/MF	AAAC		
MCP73833-GPI/MF	AAAD	MCP73834-FCI/MF	BAAC
MCP73833-NVI/MF	AAAF	MCP73834-GPI/MF	BAAD
MCP73833-6SI/MF	AAAH	MCP73834-NVI/MF	BAAF
MCP73833-CNI/MF	AAAK	MCP73834-6SI/MF	BAAH
MCP73833-96I/MF	BALD	MCP73834-CNI/MF	BAAK

* Consult Factory for Alternative Device Options.

Example:

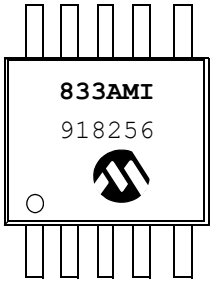

10-Lead MSOP

Part Number *	Marking Code	Part Number *	Marking Code
MCP73833-AMI/UN	833AMI		
MCP73833-BZI/UN	833BZI		
MCP73833-FCI/UN	833FCI	MCP73834-FCI/UN	834FCI

MCP73833-CNI/UN	833CNI	MCP73834-CNI/UN	834CNI

* Consult Factory for Alternative Device Options.

Example:

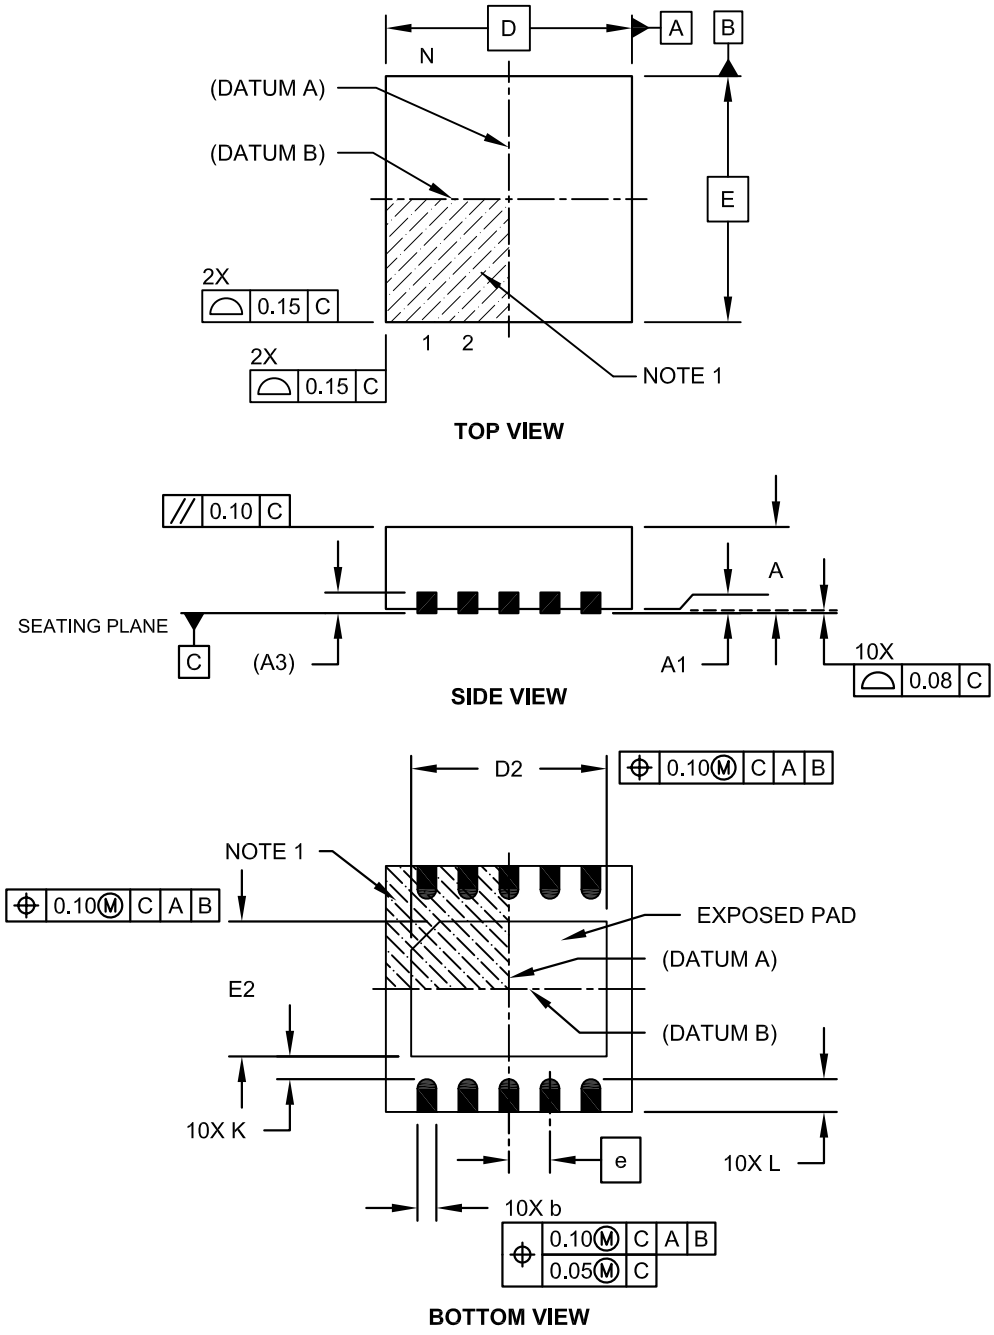

Legend:	XX...X	Product Code or Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or not include the corporate logo.

APPENDIX A: REVISION HISTORY

Revision C (September 2025)

- Added MCP73833-96I/MF (4.45V) variant to Features, Description, DC Characteristics and Product Identification System.
- Updated document layout and Package Outline Drawings (found in Packaging Information).

Revision B (May 2009)

- Added the MCP73833-6SI/MF and MCP73834-6SI/MF10-lead DFN packages.
- Updated DFN pinout (found in Pin Descriptions).
- Updated Package Outline Drawings (found in Packaging Information).

Revision A (September 2006)

- Original Release of this Document.

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
